**Important Legal Notice:** This document is provided for informational purposes only. It does not constitute investment, financial, tax, or legal advice, and it is not intended to be, and should not be construed as, an offer to sell or a solicitation of an offer to buy any securities, financial instruments, or digital assets in any jurisdiction.

## 1 Introduction

The Soqucoin whitepaper (November 28, 2025) established the technical foundations for a production post-quantum proof-of-work cryptocurrency leveraging ML-DSA-44 (Dilithium) signatures, LatticeFold+ recursive batch verification over Binius64 fields, and classical privacy via Bulletproofs++ range proofs. While the core protocol demonstrates quantum resistance with pragmatic ASIC compatibility—validating 147 confidential transactions with 2,420-byte Dilithium signatures on an unmodified Antminer L7 (9.5 GH/s)—the path to mainnet adoption requires ecosystem bootstrapping and community engagement.

This addendum introduces **SoQuBit** (pSOQ™), a Solana SPL token designed as a “quantum meme incubator” to foster pre-mainnet liquidity, community growth, and educational outreach around post-quantum cryptographic concepts. SoQuBit serves as a bridge between high-frequency DeFi activity on Solana’s low-latency infrastructure and Soqucoin™’s long-term quantum-resistant proof-of-work security model, with an *intended* 1:1 exchange mechanism to SOQ™ tokens following mainnet launch (currently targeted for Q1 2026), subject to technical implementation, security audits, and applicable law.

## 2 Utility as a Quantum Meme Incubator

### 2.1 DeFi Liquidity and Trading

pSOQ functions as a standard SPL token on the Solana blockchain. It may be listed on third-party Solana DeFi protocols, enabling participation in activities including:

- **Decentralized Exchanges (DEXs):** Listing on platforms such as Raydium allows for automated market maker (AMM)-based trading with minimal slippage and sub-cent transaction fees. These are independent third-party platforms not controlled by the Soqucoin project.
- **Lending Protocols:** Integration with platforms such as Marginfi or similar services may enable pSOQ holders to provide liquidity or use tokens as collateral. Any yields or incentives are provided by those independent protocols and are not guaranteed, endorsed, or controlled by the Soqucoin project.
- **Liquidity Mining:** Community-organized incentivized pools may reward early participants who provide liquidity pre-mainnet, creating potential economic alignment with the Soqucoin ecosystem.

These mechanisms leverage Solana’s 400ms block times and \$0.00025 average transaction costs—characteristics fundamentally incompatible with quantum-resistant lattice-based signatures (2,420 bytes) on a proof-of-work chain but suitable for rapid trading and community activity.

## 2.2 Community Engagement and Meme Culture

The “meme incubator” designation reflects pSOQ’s role in cultivating engagement around post-quantum themes:

- **Quantum-Themed Campaigns:** Marketing initiatives such as “Schrödinger’s Coin” (where token value is simultaneously alive and dead until observed on-chain) or “Lattice Legends” NFT collections may educate participants on PQ cryptography while fostering cultural identity.
- **Airdrop Mechanics:** Discord/X-based airdrops may reward community contributions (e.g., educational content, memes, technical documentation) with pSOQ tokens, subject to eligibility criteria and terms.
- **Gamification:** Challenges like “break the folding proof” (simulated cryptanalysis contests) or “hash wars” (community mining competitions on testnet) may build technical literacy while maintaining entertainment value.

pSOQ distribution occurs through community programs and liquidity incentives only. **There is no public token sale; pSOQ is not being offered in any securities offering.**

## 2.3 Educational Gateway to Post-Quantum Concepts

pSOQ acts as an accessible entry point for non-cryptographers to understand lattice-based cryptography:

- **Simplified Benchmarks:** Marketing materials translate technical achievements (e.g., PAT 9,661  $\times$  signature compression, 0.18ms LatticeFold+ verification) into relatable metrics (“1 SOQ transaction = 9,661 legacy Bitcoin signatures”).
- **Interactive Demonstrations:** Web-based tools may allow users to visualize Pedersen commitments, Bulletproofs++ range proofs, or Binius64 field operations without requiring deep mathematical background.
- **Cross-Chain Narratives:** Framing pSOQ as a “quantum refugee” from classical crypto’s inevitable demise positions Solana as a temporary platform before SOQ mainnet’s quantum-resistant infrastructure.

# 3 Pegging Mechanism and Bridge Architecture

## 3.1 Planned 1:1 Exchange Mechanism to SOQ

Following Soqucoin mainnet launch (currently targeted for Q1 2026), a bidirectional bridge *is intended to* enable pSOQ  $\leftrightarrow$  SOQ transfers:

- **Lock-and-Mint:** Users may lock SOQ on the Soqucoin chain via a CHECKLOCKTIMEVERIFY-style covenant (enforced by ML-DSA-44 multisig), triggering minting of equivalent pSOQ on Solana.
- **Burn-and-Release:** pSOQ holders may burn tokens on Solana, with proofs verified via independent cross-chain oracle infrastructure (such as Wormhole guardians), unlocking SOQ from the covenant. Oracles would attest to Solana finality (32 confirmations, 12.8s) before releasing SOQ (6 confirmations, ~600s on mainnet).

Any such bridge will be subject to independent security audits, third-party protocol risk, and evolving regulatory requirements. The mechanism relies on economic incentives (arbitrage) and cryptographic attestations rather than centralized custody. However, as atomic swaps between PoW (Soqucoin) and PoS (Solana) chains require trust assumptions, any bridge introduces a security reduction from SOQ’s quantum-resistant foundation to Solana’s ECDSA-based validator set. **There is no assurance that any particular bridge design or peg will be implemented, maintained, or remain available.**

## 3.2 Pre-Mainnet Aspirational Value

Prior to bridge deployment, pSOQ’s value is *aspirational*: it trades on speculative anticipation of future 1:1 exchangeability. To align community incentives:

- **Priority Claims:** pSOQ holders *may, subject to regulatory, technical, and economic constraints*, be eligible for priority access to SOQ airdrops (e.g., potential 1 pSOQ  $\rightarrow$  1 SOQ claim after mainnet + 30 days), rewarding early participation.
- **Burn Mechanisms:** A portion of pSOQ supply (e.g., 10%) *may* be burned periodically to reduce circulating supply, increasing scarcity and signaling commitment to long-term value alignment.
- **Transparency:** Real-time dashboards may display pSOQ circulating supply vs. anticipated SOQ allocation, helping prevent oversupply before bridge activation.

Critically, **pSOQ does not guarantee 1:1 convertibility** until bridge contracts are audited, deployed, and activated—a process contingent on mainnet security audits, technical feasibility, and regulatory clearance.

## 4 Alignment with Whitepaper Benchmarks

pSOQ’s design complements Soqucoin’s technical achievements:

- **PAT Compression:** The  $9,661\times$  reduction in signature data (from individual 2,420-byte Dilithium signatures to 100-byte PAT proofs) enables on-chain efficiency that pSOQ’s community storytelling may amplify (“9,661 signatures walk into a bar...”).
- **ASIC Validation:** Antminer L7 compatibility proves Script PoW’s robustness, while pSOQ’s potential Solana listing demonstrates cross-ecosystem adaptability—industrial-grade mining vs. retail-friendly trading.
- **Bulletproofs++ Privacy:** The 675-byte range proofs (0.89ms verification) showcase classical privacy techniques, while pSOQ’s transparent Solana ledger educates users on privacy tradeoffs before SOQ’s planned lattice-based upgrade (v0.22).

## 5 Risks and Disclaimers

### 5.1 Forward-Looking Statements

**This addendum contains forward-looking statements**, including anticipated timelines for mainnet launch (Q1 2026), bridge deployment, airdrop mechanics, and technical implementations. These statements are inherently uncertain and subject to change without notice. Actual outcomes may differ materially from those described herein. No assurance is given that any described feature, peg, mechanism, or timeline will be implemented, achieved, or maintained as described, if at all.

### 5.2 Regulatory and Legal Considerations

pSOQ is intended to function as an experimental utility token within the Soqucoin ecosystem. It does not represent equity, debt, or any ownership interest in any entity and does not entitle holders to profits, dividends, or other financial returns. pSOQ is not being offered as, and the Soqucoin project does not intend or purport to treat pSOQ as, a security in any jurisdiction; however, regulators and courts may reach different conclusions.

The following disclaimers apply:

- **No Value Guarantees:** pSOQ’s speculative value may diverge significantly from SOQ or may lose all value. There is no enforceable claim to future SOQ tokens until bridge contracts are deployed, audited, and activated.

- **Jurisdictional Restrictions:** pSOQ is not offered or sold, directly or indirectly, to “U.S. Persons” (as that term is defined in Regulation S under the U.S. Securities Act of 1933), or to persons located in, or residents or citizens of, any jurisdiction subject to comprehensive sanctions (including those administered by OFAC), or in any jurisdiction where the offer or sale of digital assets is restricted or unlawful. Participation is limited to natural persons who are at least 18 years old (or the age of majority in their jurisdiction, if higher). Compliance with local laws is the sole responsibility of participants.
- **Volatility Risk:** As a community-driven token, pSOQ may experience extreme price swings ( $\pm 90\%$  intraday or more) unrelated to Soqucoin’s technical progress or fundamentals.
- **Smart Contract Risk:** SPL token contracts, bridge oracles, AMM pools, and related infrastructure may contain vulnerabilities, bugs, or be subject to exploits. Users assume all risks of loss due to hacks, protocol failures, or technical malfunctions.
- **Third-Party Services:** References to third-party protocols or products (including, without limitation, Solana, Wormhole, Raydium, Marginfi, Antminer, or any exchanges or wallets) are for descriptive purposes only. The Soqucoin project does not control, operate, audit, or endorse these services and is not responsible for their security, availability, regulatory status, or performance.
- **Cryptographic Assumptions:** Soqucoin and pSOQ rely on post-quantum cryptographic primitives (e.g., ML-DSA-44, lattice-based assumptions) that are still the subject of active cryptanalytic research. Future advances in mathematics, cryptanalysis, or computing (including quantum computing) may compromise some or all of these assumptions, which could result in partial or total loss of value or security.

### 5.3 Intellectual Property

The “Soqucoin” and “SOQ” names, logos, and related branding (together, the “Marks”) are trademarks, with registration pending in certain jurisdictions. Unauthorized use, impersonation, or creation of confusingly similar or derivative tokens (including, without limitation, any token purporting to represent or be associated with Soqucoin without authorization) violates intellectual property rights and may result in legal action. Official communications originate exclusively from [soqu.org](https://soqu.org), [@soqucoin](https://twitter.com/soqucoin) (X), or verified Discord channels (<https://discord.gg/kc6GMmbZvX>). All other trademarks, service marks, and trade names referenced in this document are the property of their respective owners.

### 5.4 Not Financial, Investment, Tax, or Legal Advice

This addendum is informational only. Nothing herein constitutes financial, investment, tax, or legal advice. pSOQ acquisition involves substantial risk, including total loss of capital. Consult qualified professionals in your jurisdiction before acquiring pSOQ or SOQ. Past performance (e.g., testnet benchmarks, technical demonstrations) does not predict future results.

## 6 Conclusion

pSOQ represents a strategic extension of Soqucoin’s post-quantum vision—potentially bridging the gap between today’s DeFi-native users and tomorrow’s quantum-resistant infrastructure. By leveraging Solana’s speed and accessibility for community growth while maintaining SOQ’s commitment to lattice-based security and ASIC-compatible mining, this dual-token model aims to balance immediate liquidity needs with long-term censorship resistance.

The “quantum meme incubator” framework acknowledges that cryptographic innovation alone cannot achieve adoption; cultural resonance, economic incentives, and educational outreach are equally critical. pSOQ’s success will be measured not in price charts but in the number of participants who transition from memetic engagement to genuine understanding of why Shor’s algorithm necessitates Soqucoin’s existence.

As quantum computing advances from laboratory prototypes to practical threats, the store-now-decrypt-later risk demands action today. pSOQ serves as the community’s potential rallying point—a speculative initiative in a future where “quantum-resistant” is no longer a niche concept but a baseline requirement for digital value transfer.
